SLICERMORPH

Why reproducible research?

“Computation-based science publication is currently a doubtful enterprise because there is not enough support for identifying and rooting out sources of error in computational work ”
— Donoho (2010)

“an article about computational result is advertising, not scholarship. The actual scholarship is the full software environment, code and data, that produced the result”
— Claerbout and Karrenbach (1992)

Why scientists want reproducible research?

- **Improved work and work habits**
- **Improved teamwork**
- **Greater impact**
- **Greater continuity and cumulative impact**

How do you record the history of your projects?

Best practice is version control

Version control starts with a base version of the document, and it saves just the changes you made at each step of the way.

Git is a version control system

Github is a hosting service for Git

Git and Github in a larger community

- Exposure
- Be a keener

- Collaboration

Compare with

- Edit save and attach
- Google doc

What Git/Github is not

- A real-time collaboration tool
- A backup replacement
- Keeping files in sync real-time (e.g., Dropbox)
- Not good with binary files (office docs, pdfs, pictures, etc.)

Some basic git commands

- Git add *
- Git commit -m “commit message”
- Git push
- Git pull

In this lab, we will

- Get Git working in Rstudio
- Pull from SlicerMorphWorkshop
- Create your own repository and make a push
- Markdown

Exercise 1: pull from workshop GitHub page

- **Please go to this page for instructions**

https://github.com/SlicerMorph/S_2019

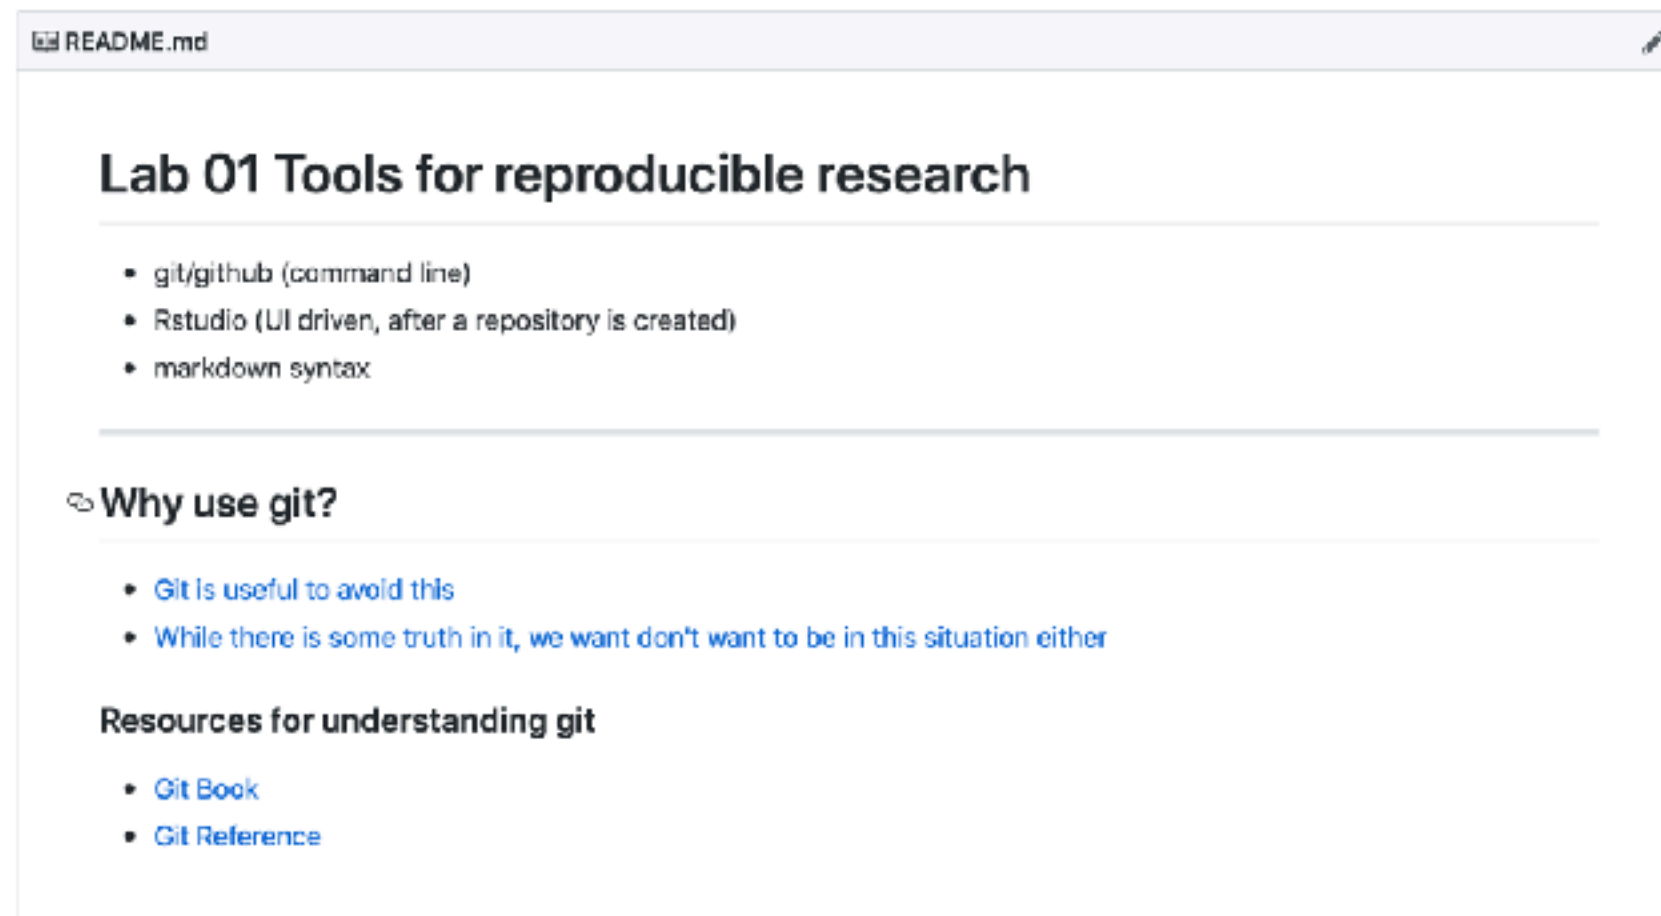

Exercise 2: create your own repository and push

- **Please go to this page for instructions**

https://github.com/SlicerMorph/S_2019

Markdown is a way to style text on web

Our webpage is written via Markdown

Mostly, Markdown is just a regular text with a few non-alphabetic characters thrown in like # or *.

Markdown examples

Text: **bold**, *italic*, [link](#)

```
It's very easy to make some words bold and other words  
italic with Markdown. You can even  
[link to Google!](http://google.com)
```

It's very easy to make some words **bold** and other words *italic* with
Markdown. You can even [link to Google!](#)

Markdown examples

List, bullet point, dashes

Sometimes you want numbered lists:

1. One
2. Two
3. Three

Sometimes you want bullet points:

- * Start a line with a star
- * Profit!

Alternatively,

- Dashes work just as well
- And if you have sub points, put two spaces before the dash or star:
 - Like this
 - And this

Sometimes you want numbered lists:

1. One
2. Two
3. Three

Sometimes you want bullet points:

- Start a line with a star
- Profit!

Alternatively,

- Dashes work just as well
- And if you have sub points, put two spaces before the

Images:

If you want to embed images, this is how you do it:

```
![Image of Yaktocat]  
(https://octodex.github.com/images/yaktocat.png)
```

If you want to embed images, this is how you do it:

Markdown examples

Headers ## and quotes >:

```
# Structured documents
```

Sometimes it's useful to have different levels of headings to structure your documents. Start lines with a `#` to create headings. Multiple `##` in a row denote smaller heading sizes.

```
### This is a third-tier heading
```

You can use one `#` all the way up to `#####` six for different heading sizes.

If you'd like to quote someone, use the > character before the line:

```
> Coffee. The finest organic suspension ever devised... I beat  
the Borg with it.
```

```
> - Captain Janeway
```

Markdown examples

Headers `##` and quotes `>`:

Structured documents

This is a third-tier heading

You can use one `#` all the way up to `#####` six for different heading sizes.

If you'd like to quote someone, use the `>` character before the line:

`>` Coffee. The finest organic suspension ever devised... I beat the Borg with it. - Captain Janeway

Markdown examples

Task list: [x] and emoji :EMOJICODE:

```
GitHub supports many extras in Markdown that help you reference
and link to people. If you ever want to direct a comment at
someone, you can prefix their name with an @ symbol: Hey
@kneath – love your sweater!
```

```
But I have to admit, tasks lists are my favorite:
```

- [x] This is a complete item
- [] This is an incomplete item

```
When you include a task list in the first comment of an Issue,
you will see a helpful progress bar in your list of issues. It
works in Pull Requests, too!
```

```
And, of course emoji!
```
